Create a single blank JavaScript project in Codeply (https://www.codeply.com/) to complete the two exercises below and return a single URL for your completed project containing both parts. Do not use any external frameworks, libraries or CSS preprocessors such as angular, jquery, bootstrap. Please do not mention the company name anywhere in your project.

Part 1 – HTML/CSS

Construct this UI using HTML and CSS, matching the visual design as closely as possible.

Part 2 – JavaScript

This is a separate JavaScript coding exercise with no UI interaction.

Write a single function that takes two string inputs and returns a single string of either "TRUE" or "FALSE". The function should determine if the first input is equal to the second input when you are able to modify the first string input. The following modifications to the first string input are permitted: letters may be capitalized, or discarded, but otherwise not changed.

Console.log the following examples:
('ebCde','BCD') TRUE
('eCB','ECB') TRUE (e was uppercased)
('BcdEF','BCEF') TRUE (c was uppercased, d was discarded)
('BCD','BcD') FALSE (C could not be lowercased)
